COUNTY GROUND WATER STUDIES 7

GEOLOGY AND GROUND WATER RESOURCES

of

RICHLAND COUNTY

PART 2 — BASIC DATA

by

CLAUD H. BAKER, JR.

Geological Survey

United States Department of the Interior

**Prepared by the United States Geological Survey
in cooperation with the North Dakota State
Water Commission, the North Dakota Geological Survey,
and the Richland County Board of Commissioners.**

Grand Forks, North Dakota

1966

This is one of a series of county reports published cooperatively by the North Dakota Geological Survey and the North Dakota State Water Conservation Commission. The reports are in three parts; Part I describes the geology, Part II presents ground water basic data, and Part III describes the ground water resources. Parts I and III will be published later and will be distributed as soon as possible.

INTRODUCTION

Purpose and Scope

This report on the ground-water basic data for Richland County, North Dakota, is intended to serve two purposes: 1) to make available to the public the basic information needed to facilitate water-supply developments, and 2) to supplement the reports on geology and ground-water resources of the county which will be published later. Figure 1 shows the location of Richland County and other counties in North Dakota in which ground-water studies have been made or are in progress.

Most of the data were collected during 1962, 1963, and 1964 as part of the study of the geology and ground-water resources of Richland County. The study is a cooperative effort of the U.S. Geological Survey, the North Dakota State Water Conservation Commission, and the Richland County Board of Commissioners. Information obtained during four earlier ground-water studies in the county has been incorporated into this study; those studies were made in the areas of Wyndmere (Dennis and others, 1949), Kindred (Dennis and others, 1950), Fairmount (Paulson, 1953), and Hankinson (Powell, 1956).

During this study, information was obtained concerning approximately 2,300 wells in the county. About 450 of these wells were sampled for conductivity determinations, and 49 were sampled for chemical analyses. Seventy-five test holes, totaling more than 19,000 feet, were drilled, and observation wells were installed in 39 of them. Water samples from 28 of the observation wells were collected for chemical analysis, making a total of 73 analyses. In addition to the 39 newly-installed observation wells, periodic water-level measurements were made in 18 existing wells, so that water-level records were obtained for a total of 57 wells. Five wells were equipped with continuous water-level recording devices. All of the information is tabulated in this report.

Well-Numbering System

The wells, test holes, and springs listed in the tables are numbered according to their location within the United States land survey system (fig. 2). North Dakota is in the area surveyed from the fifth principal meridian and its baseline; townships are all north of the baseline and ranges all west of the meridian. The first numeral of the well number indicates the township, the second numeral the range, and the third numeral the section in which the well or test hole is located. The letters following the section number locate the well within the section; the first denotes the quarter section, the second the quarter-quarter section, and the third the quarter-quarter-quarter section or ten-acre tract. In each case, the letters a, b, c, and d refer to the

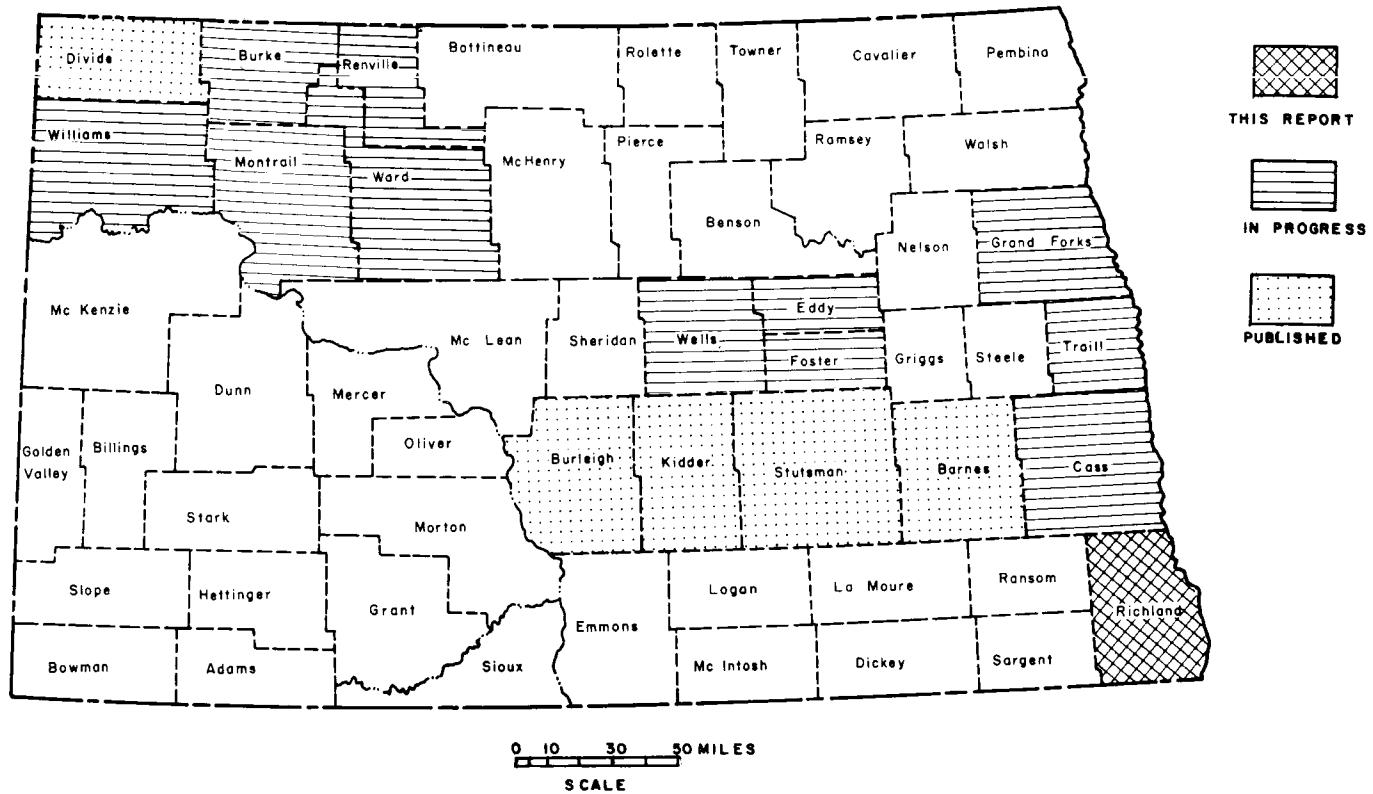

Figure I. County ground-water studies in North Dakota.

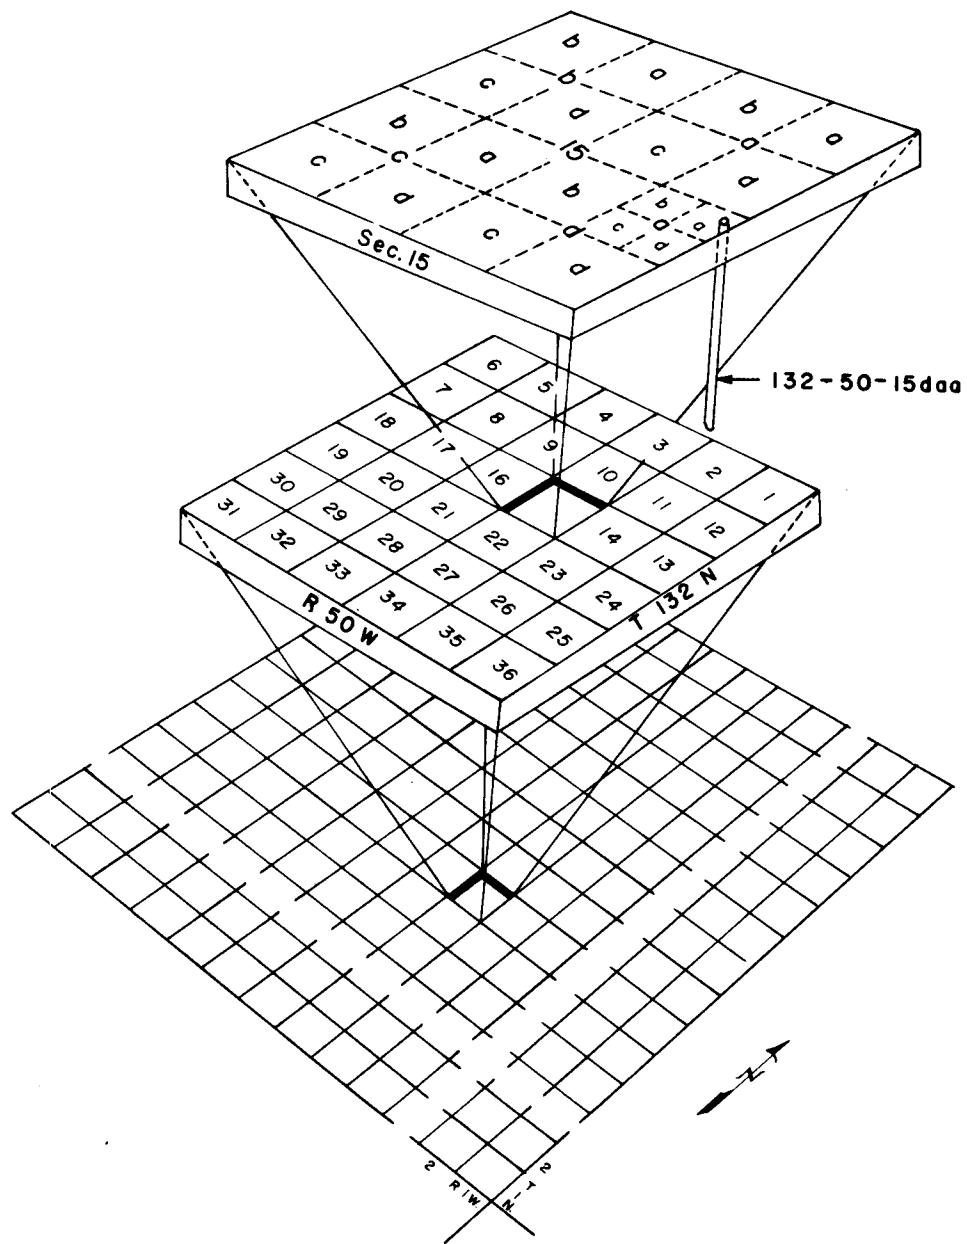

FIGURE 2--SYSTEM OF NUMBERING SPRINGS, WELLS, AND TEST HOLES.

northeast, northwest, southwest, and southeast elements of the division. If more than one well or test hole is recorded within a single ten-acre tract, numbers 1, 2, 3, etc., are added after the letters. Thus, well number 132-50-15daa2 is the second well in the NE¹₄NE¹₄SE¹₄ sec. 15, T. 132N., R. 50W. The system is somewhat complicated in Richland County by the presence of a portion of the Wahpeton and Sisseton Indian Reservation. Section lines within the reservation do not correspond with those outside it, and some sections (129-52-9, for example) occur both inside and outside the reservation. Locations within the reservation are indicated by the notation LTL (Lake Traverse Lands) following the range-township-section descriptions.

Utility of Data

The information contained in this report is necessary in the evaluation of ground-water conditions in Richland County. The characteristics of existing wells and sources of ground water are shown in table 1 and figure 3 (in pocket). Figure 4 (in pocket) shows locations of test holes and observation wells; logs of test holes are given in table 4, and water-level records for the observation wells are in table 2. Figure 5 (in pocket) shows the locations of wells sampled for chemical analysis and table 3 gives the analyses of water from these wells. The usefulness of the data will be enhanced by a study of the geology and ground-water resources reports when they become available.

Most of the headings in table 1 are self-explanatory or are explained at the beginning of the tables. Column 12, specific conductance, gives the electrical conductivity of water from selected wells in micromhos per centimeter at 25°. This figure depends on the quantity of dissolved solids in the water; the greater the quantity, the higher the specific conductance. Roughly, specific conductance multiplied by a factor of 0.65 approximates total dissolved solids in parts per million (ppm). Specific conductance can be used as an index of water quality, but it must be used carefully, because for many uses the quantity of mineral matter dissolved in water is less important than the nature of the minerals. In Richland County waters with high conductance readings generally are soft, but may have an objectionable salty taste. Conversely, the waters with low conductance readings are generally better tasting, but are commonly hard.

The logs given in table 4 present graphic as well as verbal descriptions of the materials penetrated in each test hole. They also include electric logs. The electric logs denote the measurement of the electrical properties of material penetrated in the test hole. They are of use in identifying the various beds penetrated in a test hole, determining the depth and thickness of an aquifer or impermeable bed, and determining the quality of water and porosity of an aquifer. A complete discussion of electric-log interpretations is not feasible in this report. Briefly, the potential curve is

generally deflected to the left in a more permeable formation and to the right in a less permeable one. Similarly, the resistivity curve is deflected to the right in a more permeable material, to the left in a less permeable one.

All logs were prepared from analyses made by geologists of the North Dakota State Water Conservation Commission at the drilling site during the actual drilling.

TABLE 1.-- Records of wells, springs, and test holes

Depth of well: Measured depths are in feet and (or) tenths; reported depths are in feet.

Type: B, bored; Dr, drilled; Du, dug; Dv, driven; Sp, spring.

Depth to water below land surface: Measured depths are in feet and tenths; reported depths are in feet.

Use of water: D, domestic; I, industrial; O, observation well; P, public supply; RR, railroad; S, livestock; T, test hole; U, unused.

Water-bearing materials: Gr, gravel; Sd, sand, Ss, sandstone; T, till.

Geologic unit: Kd, Dakota Sandstone (may include other bedrock water-bearing units of Cretaceous age or older); Qab, deposits of Lake Agassiz beaches; Qasd, Sheyenne delta deposits of glacial Lake Agassiz; Qd, till and associated glacioaqueous deposits (includes buried and surficial outwash deposits and isolated bodies of sand and gravel within the till); Qm, Milnor channel deposits.

Remarks: C, chemical analysis given in table 3; CF, CH, or CW, chemical analysis published in Fairmount, Hankinson, or Wyndmere report; L, log given in table 4; LF, LH, LK, or LW, log published in Fairmount, Hankinson, Kindred, or Wyndmere report.

Table 2 - Water levels in selected observation wells

Depth to water in feet and hundredths below
land surface

Source of water; Kd, Dakota Sandstone, Qd,
till and associated glacioaqueous deposits,
Qab, deposits of Lake Agassiz beaches, Qasd,
Sheyenne delta deposits of glacial Lake
Agassiz.

129-48-24daa2

Total depth 120 ft.

Table 3. Chemical analyses of water from selected wells

SOURCE: Kd, Dakota Sandstone, may include other bedrock water-bearing units; Qd, till and associated glaciogenous deposits, includes buried and surficial outwash deposits and isolated bodies of sand and gravel within the till; Qab, deposits of Lake Agassiz beaches; Qasd, Sheyenne delta deposits of glacial Lake Agassiz; Qm, Milnor channel deposits.

NOTES:
 1 - Difference between anion and cation equivalents per million (ppm) exceeds one percent of total anion-cation equivalents.
 2 - Precipitate (CaCO_3) noted on wall of sample container at time of analysis.

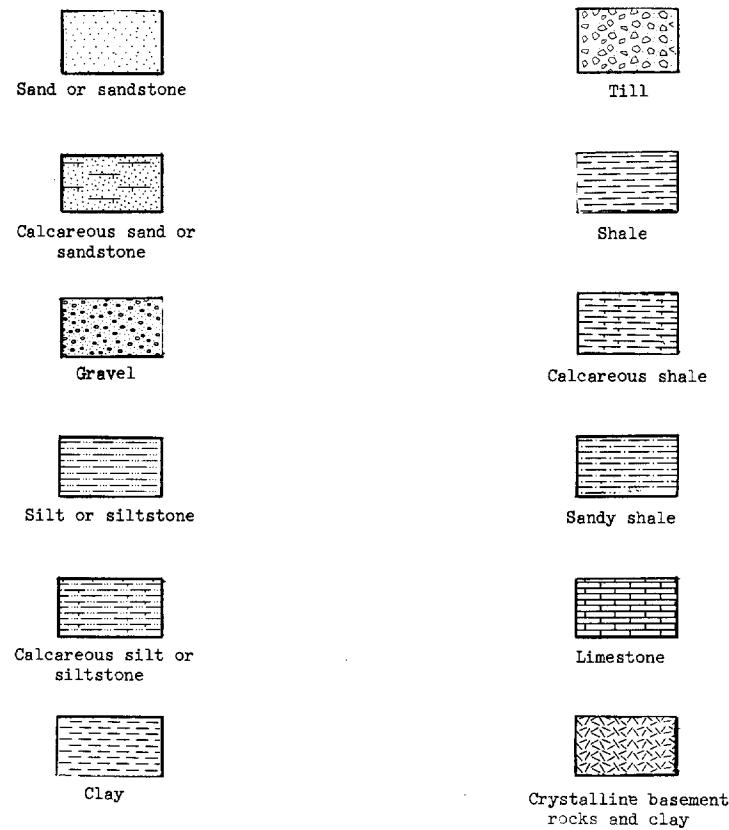

Location	Depth Feet	Source	Date of collection	Tem- pera- ture (°F)	Silica (SiO_2)	Total iron (Fe)	Calcium (Ca)	Mag- ne- sium (Mg)	Sodium (Na)	Potas- sium (K)	Bicar- bonate (HCO_3)	Carbo- nate (CO_3)	Sulfate (SO_4)	Chloride (Cl)	Fluo- ride (F)	Nitrate (NO_3)	Boron (B)	Dissolved solids		Analyses by State Laboratories Department, Bismarck, North Dakota			Specific conduct- ance (micro- mhos at 25°C)	pH	Remarks
