The Department of Water Resources operates the Devils Lake outlets according to specific operating plans.

E-mail notifications are sent out to interested parties when the outlets are turned on and off at the beginning and end of the operating season, as well as during longer-term periods of outlet inactivity due to maintenance or mechanical issues.

Discharges from the Devils Lake outlets are frequently adjusted to meet water quality and quantity limitations, so it is impractical to provide notification for every change in outlet operation.

Real-time streamflow values can be obtained from the USGS, and three gage sites can be used to determine the rate of outlet discharges. Flow values may vary from the current actual discharge, due to local inflow and the time lag as noted. However, these sites provide the best means available to estimate the current outlet discharge rates.
